How to Use This Guide

This guide shows, mostly in diagrams, **how OudhTrade's admin (staff) screens are designed**: one console, a small set of shared patterns and shared components, and one process for adding or changing a screen. Each page has one diagram and two short lines: why it matters and how to read it.

Exact screen texts, messages and error codes stay in the module UX specs; the diagrams name the section to use. Release labels anywhere are planning hints only — the team decides timing.

What is in this guide

Part	Answers the question
A Why this design	Why one console and shared patterns? What does the console look like? Who sees what? What are the building blocks?
B Pattern flowcharts	How does each pattern work, step by step, and who acts? Which states and rules apply everywhere?
C Coverage of all 20 modules	Which pattern does every admin screen of every module use? How much is reused?
D Adding or changing a screen	Which pattern fits a new need? Who does what? What if a shared part changes?
E Onboarding journeys	How do the staff screens work together in the five main onboarding journeys?
F One-page summary	Everything above on one poster
Summaries	Status lifecycles, the top 5 screen flows and role × action permissions on one page each (full versions are in the Admin Design Master)

Pattern colours used in every diagram

Pattern	Use it when staff ...	Status
P1 Queue + case review (blue)	decide on a case	Designed (AD-01 to AD-09)
P2 Settings editor (orange)	change a rule or value for many users	Designed (AD-10 to AD-18)
P3 List management (green)	manage a list of people or items	Designed (AD-19 to AD-23)
P4 Look-up (purple)	find and read only	Designed (AD-24, AD-25)
P5 Dashboard (sky blue)	watch numbers or charts	Future pattern (agreed)
P6 Bulk actions (red-orange)	do the same action on many items	Future pattern (agreed)
P7 Content page editor (yellow)	write or edit a rich-text page	Future pattern (agreed)

Colours come from a colour-blind-safe set and every diagram also names the pattern in words. Dashed boxes mean future or planned ("planned — confirm when the module is designed").

Where facts come from

Source	Holds
M01-6 §12, M02-6 §20, M03-6 §14, §16, §17, §20	Exact screen texts, messages, error codes and rules
Admin UX Design Brief + Admin Screens Tracker	The 25 screens AD-01 to AD-25, patterns, sketches, design status
M0x-2, M0x-3, M0x-5 · PRD §3.2 · Figma decisions	Rules, staff API, events, tables; staff roles; product-owner decisions

Part A — Why This Design

A1 Why one console and shared patterns

Why: the 25 onboarding staff screens do only four kinds of work. Designing and building each one on its own would repeat the same security, audit and approval logic 25 times.

How to read: left, the cost of 25 one-off screens; right, the same 25 screens as 4 patterns built from 12 shared components.

Figure 1 — 25 screens → 4 patterns + 12 shared components

A2 Console map — layout and menu

Why: every staff screen sits in one shell (M15 Operations and M16 Configuration share one look, decided 26 Sep 2026), so staff always find search, queues and the decision bar in the same place.

How to read: left, the shell parts; right, the five menu groups with the screen IDs under each, coloured by pattern.

Figure 2 — Console shell and the five menu groups

A2 Who sees which menu item

Why: a menu item a role may not use is left out, not shown disabled; opening its address gives STAFF_NOT_PERMITTED.

How to read: a dark cell with a tick means the item is in that role's menu. What the role may do there is in the role × action summary (end of this guide).

Who sees which menu item

OudhTrade • Admin design

Role visibility — a menu item a role may not use is left out, not shown disabled (M01-6 §12, M02-6 §20)

Menu item	Super Admin	Admin	Moderator	Senior flag	Finance	Content Editor	Support

What each role may do on a screen (view, act, decide) is in the role and action summary. Field agents use the agent app, not the console.

Legend:
Shown in the menu for this role
Left out (not shown)
P1 Queue + case review
P2 Settings editor
P3 List management
P4 Look-up

Figure 3 — Role visibility — Super Admin, Admin, Moderator (+ Senior flag), Finance, Content Editor, Support

A3 Building blocks — four layers

Why: designers and developers build from the bottom up: the Design System, then 12 shared admin components, then 4 patterns; a screen only adds what differs.

How to read: each layer uses only the layer below. A new part that is not in layer 2 is a component change (Section D3).

Figure 4 — Design System → shared components → patterns → screens

Part B — Pattern Flowcharts

B1 P1 Queue + case review

Why: nine screens (AD-01 to AD-09) decide cases the same way: shared queue, secure viewer, reason codes, decision bar, message to the user and audit.

How to read: lanes show who acts. Solid arrows are the main path; dashed arrows are questions, holds, escalations and new copies.

Figure 5 — P1 Queue + case review — states and who acts

B2 P2 Settings editor

Why: every setting in every module changes the same way (M01-6 §12.1): draft, preview impact, second person approves, publish or schedule, history, roll back.

How to read: the diamond "High impact?" picks the approver. The right panel lists which settings are high impact and which are other.

Figure 6 — P2 Settings editor — two-level approval

B3 P3 List management

Why: invitations, field agents, delegations, farm-visit tasks and re-checks are lists of people or items with the same add, change and end actions.

How to read: every change goes through the confirm dialog (what happens, who is told, reason); the bulk upload branch applies where the screen has it (AD-19).

Figure 7 — P3 List management — add, change, end, bulk upload

B4 P4 Look-up

Why: staff often only need to find and read an account. Look-up never changes data; it hands off to an action screen.

How to read: a reason is asked before any account opens; "Show" of a full contact exists only in recovery and reclaim cases (60 seconds, logged).

Figure 8 — P4 Look-up — search, reason, read-only summary, hand-off

B5 Common states and rules

Why: these states and rules are designed once and appear on every screen of every pattern, including the future P5–P7.

How to read: grey boxes are states a screen can be in (exact texts from M01-6 §12.1 and M02-6 §20); brown boxes are rules; the red box lists what is never allowed.

Figure 9 — Common states and rules for all patterns

Part C — How It Covers All 20 Modules

C1 Coverage map (M01–M05)

Why: the same seven patterns cover the admin screens of all 20 modules. Today 82 admin screens are counted: 25 in the Admin UX Design Brief, 16 more specified in module UX specs, and 41 planned.

How to read: planned screens (dashed, grey) are "planned — confirm when the module is designed"; future patterns P5–P7 are built on the same console, components and rules.

Coverage map — modules M01–M05							
OudhTrade • Admin design							
Which pattern each admin screen uses. Dashed = planned — confirm when the module is designed							
Module	P1 Queue + case review	P2 Settings editor	P3 List management	P4 Look-up	P5 Dashboard (future)	P6 Bulk actions (future)	P7 Content page editor (future)

M12 Moderation & Compliance Ops	Reports queue Takedowns Enforcement ladder Legal orders	Banned words			Transparency report		
M13 Notifications		Message templates	Sender domains	Delivery log look-up			
M14 Dashboards (user dashboards are not admin)		Dashboard widget settings					
M15 Operations Console (the shell itself)			Staff & partners	Global search	Queue health & KPI dashboard		
M16 Configuration Console		Generic settings editor Changes / approvals AD-18					
M17 Content & Legal							Help centre, guides, legal pages
M18 Analytics & Monitoring					KPI & monitoring dashboards		
M19 Mobile Apps		App version / force update					
M20 Testing & Go-Live	No admin screens — test tools only						

Key: In the 25-screen brief Specified in a UX spec Planned

Figure 11 — Coverage map, modules M06–M20

C2 Reuse chart

Why: 74 of 82 admin screens (90 %) reuse the four patterns that exist now. Only 8 need a future pattern.

How to read: dark = in the 25-screen brief; light = specified in a module UX spec; dashed = planned. Counts come from the coverage map above.

Figure 12 — Admin screens per pattern across all modules

Part D — Adding or Changing an Admin Screen

D1 Which pattern?

Why: most new staff needs fit an existing pattern; a new pattern is the exception and needs the product owner.

How to read: ask questions 1 to 7 in order; the first "Yes" picks the pattern. If none fits, the four criteria on the right decide.

Figure 13 — Decision tree — which pattern for a new admin screen

D2 Process from need to release

Why: one path for every new admin screen: the product owner approves the need and the pattern, the spec comes first, the designer draws only what differs.

How to read: lanes are the people. Release timing is decided by the team; release labels are planning hints only.

Figure 14 — Process swim-lane — product owner, spec writer, designer, developers, QA

D3 Changing a screen or a shared pattern

Why: a change to a shared component or pattern changes every screen that uses it. It needs the product owner's approval with the full impact list from the Admin Screens Tracker.

How to read: top path = one screen only; bottom path = shared change, done in one batch across the brief, tracker and every affected spec, then regression-tested.

Figure 15 — Impact check for changes

Part E — Onboarding Journeys

E1 Business verification

Why: this is the most used staff flow at launch; it shows how AD-01, AD-10 and the automatic-approval audit fit together.

How to read: lanes are the user, the system, the Senior Moderator, the Moderator on AD-01 and Admin. Quoted texts are the user messages (M03-6 §8.2, §17).

Figure 16 — E1 Business verification journey

E2 FPO onboarding and member farmers

Why: FPOs bring many farmers at once; staff screens AD-01, AD-19 and AD-23 keep this safe with the badge, the 50-open limit and 10 % re-checks.

How to read: a farmer may belong to several FPOs; each link is confirmed separately and any one confirmed link gives "Verified farmer" (decided 26 Sep 2026).

Figure 17 — E2 FPO onboarding and member farmers

E3 Field agent onboards a farmer

Why: field agents onboard farmers on a phone, often offline. Staff set agents up on AD-20, review on AD-01, plan visits on AD-22 and review visits on AD-05.

How to read: the agent app screens S13 and S14 are mobile (not the console). Quality re-checks run on AD-23.

Figure 18 — E3 Field agent farmer onboarding

E4 Buyer asks to sell — one combined case

Why: the user sees one case, not two: a Moderator checks documents and identity and recommends; an Admin decides role and verification together.

How to read: "Ask for documents" can happen on AD-01 or AD-04; the case goes to documents_needed and returns to in_review with a new dated time.

Figure 19 — E4 Buyer → seller combined case

E5 Settings change — document checklist

Why: document checklists are high impact: a wrong list blocks sellers of a whole country. The flow shows P2 in real use.

How to read: the Super Admin who approves is never the editor; open cases keep the checklist version they were sent with.

Figure 20 — E5 Settings change on AD-10

Part F — One-Page Summary

F1 Console, patterns, modules and process

Print this page for design reviews: one shell, seven patterns, the modules that use them, the process and the rules on every screen.

Figure 21 — One-page summary poster

Summaries

S1 Status lifecycles

Why: designers need every status chip; developers and QA need every allowed move. The main path is shown left to right; side states sit under each row.

How to read: colour shows the kind of state (in progress, good end, waiting for the user, refused or ended). Full state diagrams are in the Admin Design Master, Section G.

Figure 22 — Status lifecycles at a glance

S2 Top 5 screen flows

Why: these five screens carry most of the onboarding work and set the example for their patterns.

How to read: the main clicks only, left to right; white boxes with a dark border are dialogs that ask a reason. Every state, message and error is in the Admin Design Master, Section H.

Figure 23 — Top 5 screen flows — AD-01, AD-19, AD-20, AD-05, AD-10

S3 Role × action permissions

Why: QA tests every role on every screen; developers enforce the same rules in the API. Support never decides; nobody approves their own change.

How to read: darker = more power (view → note only → act → decide / approve); every cell also has words. The table for all 25 screens is in the Admin Design Master, Section I.

Role × action permissions — summary
